PART I: EXECUTIVE FOUNDATION

1.0 Executive Summary

FarmSense constitutes the definitive technical, operational, and financial deployment blueprint of a Deterministic Farming Operating System (DFOS), integrating across Subdistrict 1 of the San Luis Valley (SLV), Colorado.

1.0.1 Primary Objectives

20–30% reduction in irrigation water consumption

18–22% increase in crop return on investment (ROI)

Legally defensible Digital Water Ledger for Water Court admissibility

1.0.2 Core Innovation

Replace stochastic, intuition-based agricultural practices with a high-fidelity, rule-based computational engine optimizing the Soil-Plant-Atmosphere Continuum (SPAC) using a multi-layered sensor network.

1.0.3 Economic Catalyst

The Rio Grande Basin faces severe hydro-economic crisis. With 89,000 acre-foot annual aquifer depletion and $500/AF groundwater pumping fees (quadrupled from $75-150/AF), FarmSense shifts from agronomic optimization tool to legal necessity.

1.0.4 Leadership

Jeremy Beebe serves as Chief Executive Officer of bxthre3 inc., with successful startup exit track record (Hempvada).

1.1 Hydro-Economic Logic and The Deterministic Paradigm

1.1.1 The San Luis Valley Crisis as Economic Multiplier

Geographic Context: - Elevation: 7,500-8,000 feet above sea level - Precipitation: 7-10 inches annually - Irrigated agriculture: 300,000 acres dependent on snowmelt and aquifers - Reservoir storage: 26% of historical capacity - Annual aquifer depletion: 89,000 acre-feet

1.1.2 The $500/AF Fee Structure

The Rio Grande Water Conservation District (RGWCD) implemented a punitive $500 per acre-foot groundwater pumping fee to combat over-consumption. This represents a quadrupling of previous costs ($75-150/AF).

For a 126-acre center pivot consuming 252 AF/season: - 20% water reduction = 50.4 AF saved per season - 50.4 AF × $500/AF = $25,200

direct savings per pivot annually - FarmSense Enterprise Tier subscription: $499/month ($5,988/year) - First-year ROI: 421% return on subscription cost

1.1.3 The Deterministic Shift

Dimension	Current Industry Standard	FarmSense DFOS
Observation	Visual scouting / manual soil probe	1m centimetric Kriging with ground-truth validation
Calculation	Crop-coefficient (static, FAO-56)	SPAC thermodynamics (dynamic, real-time)
Decision	Intuition-based pumping schedules	Edge-calculated VRI prescription
Evidence	Paper logs, human memory	SHA-256 sovereign ledger, cryptographic proofs
Resolution	Field-scale (variable)	1m grid, legally admissible

1.2 SPAC Modeling and Edaphic Variability

FarmSense utilizes 11 domain-specific, explainable engines. All irrigation and trading decisions are deterministic and judgment-based — a non-negotiable requirement for Water Court admissibility.

1.2.1 Soil Layer (Edaphic)

Parameters Monitored: - Soil Matric Potential (SMP) — measure of energy required to extract water - Volumetric Water Content (VWC) — percentage of soil volume occupied by water - Electrical Conductivity (EC) — indicator of salinity and nutrient content - pH — alkalinity/acidity affecting nutrient availability - Soil temperature (affects biological activity)

1.2.2 SLV Soil Series Calibration

San Luis Soil Series: - pH: 8.4-9.8 (highly alkaline) - Exchangeable sodium: 15-60% - Primary risk: Salt buildup from irrigation - Irrigation trigger threshold: 75-80 kPa (conservative for salt management)

Gunbarrel Soil Series: - Type: Highly porous sand - Hydraulic conductivity: High (>10 cm/hr saturated) - Requirement: Low-volume, high-frequency micro-irrigation - Irrigation trigger: 20-25 kPa (low threshold due to rapid drainage)

Alamosa Soil Series: - Type: Clay loam - Water holding capacity: High - Drainage: Slow - Irrigation trigger: 50-60 kPa

1.2.3 Plant Layer (Vegetative)

Parameters Monitored: - Leaf water potential (Ψleaf) — direct measure of plant water stress - Canopy Water Stress Index (CWSI) — thermal infrared signature - Normalized Difference Vegetation Index (NDVI) — overall plant health - Stomatal conductance — indicator of photosynthetic efficiency

1.2.4 Atmosphere Layer (Meteorologic)

Parameters Monitored: - Vapor Pressure Deficit (VPD) — driving force for transpiration - Solar radiation (shortwave and photosynthetically active) - Wind speed and direction (affects evaporation) - Relative humidity - Precipitation (actual and forecasted)

Forecasting Architecture: Long Short-Term Memory (LSTM) deep learning networks process 1-9 day ensemble weather forecasts to predict ET trends with 81-94% accuracy.

1.3 Management Allowable Depletion (MAD) Framework

MAD defines the percentage of available soil water (between field capacity and permanent wilting point) that can be depleted before crop experiences physiological damage.

1.3.1 Crop-Specific MAD Thresholds

Crop	Stage	MAD %	Trigger kPa
Potato	Emergence	30%	30-40 kPa
Potato	Tuber Initiation	40%	50-60 kPa
Potato	Bulking	50%	70-80 kPa
Potato	Maturation	60%	80-100 kPa
Barley	Tillering	30%	40-50 kPa

Crop	Stage	MAD %	Trigger kPa
Barley	Grain fill	60%	80-100 kPa
Alfalfa	Establishment	40%	50-60 kPa
Alfalfa	Production	60%	80-100 kPa

1.3.2 The “Water Battery” Strategy

The Core Compute Server (Zo) delays irrigation to the “last possible minute,” utilizing the deep soil profile as a dynamic battery. This strategy: - Leaves headroom for rainfall capture - Maximizes natural precipitation utilization - Eliminates deep percolation losses - Reduces nutrient leaching - Minimizes pumping costs

1.4 System Architecture Overview

1.4.1 Backend Intelligence (Decentralized Cloud Layer)

RDC (Regional Data Center / Map Servers): - Function: Master data library - Data types: Sentinel-2 multispectral imagery, Landsat thermal, historical edaphic datasets - Update frequency: Sentinel-2 (5-day revisit), Landsat (16-day revisit)

Spatial Query Engine (Map Manager / Oracle): - Function: Extracts spatial values at precise latitude/longitude coordinates - Operations: Point queries, polygon intersection, raster sampling - Output: Lightweight JSON arrays for edge processing - Technologies: PostGIS, STAC API integration

Core Compute Server (Zo): - Location: brodiblanco.zo.computer / cloud infrastructure - Functions: Bayesian priors, Localized Kriging algorithms, Worksheets generation, Ledger vaulting - Capacity: Processes hundreds of thousands of data points into predictive spatial grids

1.4.2 Regional/District Edge Infrastructure

Regional Superstation (RSS) — Level 3: - Location: Monte Vista, Colorado - Function: Territory master, equal cloud counterpart to backend intelligence - Form factor: Modified 40-foot High-Cube shipping container - Compute: 64-Core AMD Threadripper PRO, 512GB ECC RAM - Storage: 50TB Enterprise NVMe array (hot), 200TB cold archive - **Critical capability:** Continues full operation during total regional internet or cellular blackouts

District Hub (DHU) — Level 2: - Mounting: 35-foot Class 4 timber pole - Coverage radius: 100 pivots with extreme overlapping redundancy - Compute: NVIDIA Jetson Orin Nano (8GB RAM, Ampere GPU) - **30-Day "Black Box" Cache:** 128GB Swissbit PSLC Industrial SSD

1.4.3 Field Layer (Level 1-1.5) — CRITICAL HIERARCHY

Level	Device	Function	Elevation	Reporting Target
1.5	**PMT (Pivot Motion Tracker)**	**Field Aggregator / Hub**	10-15 ft on pivot	DHU
1	**VFA (Vertical Field Anchor)**	Deep-truth probe	Ground level (buried)	**PMT**
1	**LRZ1 (Lateral Root-Zone Basic)**	Spatial scout	Ground level (buried)	**PMT**
1	**LRZ2 (Lateral Root-Zone Reference)**	Spatial scout + VWC	Ground level (buried)	**PMT**
1	**PFA (Pressure & Flow Anchor)**	Wellhead sentry	Ground level	**PMT**

CRITICAL ARCHITECTURE POINT: The PMT (elevated on the pivot span at 10-15 feet) serves as the **Primary Field Aggregator**. All ground-level devices (VFA, LRZ1, LRZ2, PFA) report upward to the PMT via 900MHz CSS LoRa. The PMT then: 1. Aggregates all sensor data 2. Performs Edge-EBK computation (50m grid) 3. Packages into encrypted payload (~187 bytes) 4. Transmits to DHU via 2.4GHz/LTE-M

This elevated topology circumvents the dense water canopy that attenuates ground-level signals.

1.5 Telemetry Architecture Resolution

1.5.1 The VFA-to-DHU Challenge (Resolved)

Initial Design Flaw: - VFA specified 900MHz CSS LoRa uplink - DHU specified 2.4GHz Ubiquiti LTU only - **Resolution:** DHU BOM revised to include 900MHz CSS LoRa gateway alongside 2.4GHz array

1.5.2 The PMT Field Hub Solution (CONFIRMED)

The PMT as Primary Field Aggregator: - PMT elevated 10-15 feet on pivot span - All field sensors (VFA, LRZ1, LRZ2, PFA) report to PMT via 900MHz CSS LoRa - PMT aggregates, computes Edge-EBK, and routes to DHU - This topology entirely circumvents dense water canopy attenuation

1.5.3 LRZ1 vs LRZ2 Distinction (CRITICAL)

Feature	LRZ1 (Basic)	LRZ2 (Reference)
Cost	$29.00	$54.30
Sensors	Dielectric only	Dielectric + Temperature
Calibration	Standard	Enhanced
Role	Spatial density filler	Ground-truth anchor
Reporting	To PMT	To PMT
Power	2.6Ah LiSOCl2	2.6Ah LiSOCl2

Deployment Ratio: - LRZ2 (Reference): 4 per field - LRZ1 (Basic): 12 per field - Total: 16 LRZ nodes per standard field

1.6 Risk Factor Analysis

1.6.1 Geopolitical Water Scarcity

Interstate litigation could trigger federal aquifer takeovers. The Sovereign Ledger enables state engineers to prove compact compliance, reducing federal intervention standing.

1.6.2 Technical Obsolescence

FarmSense is “Sensor-Agnostic.” The Hydrologic Oracle becomes the “Inference Layer” fusing satellite trends with sub-surface realities — a moat satellite-only players cannot cross.

1.7 Long-Term Roadmap: Sovereign Water Infrastructure

1.7.1 Phase Timeline

Phase	Timeline	Scope	Fields
1	2026-2027	SLV Subdistrict 1	1,280
2	2028-2029	Colorado River Basin	5,000+
3	2030+	National (High Plains)	25,000+
4	2030+	International	100,000+

None

Part II: Market Intelligence

PART II: MARKET INTELLIGENCE & STRATEGIC FUNDING

2.0 Market Overview

FarmSense operates within the global precision agriculture market, specifically targeting water-constrained regions with regulatory enforcement mechanisms.

2.1 TAM/SAM/SOM Analysis

2.1.1 Total Addressable Market (TAM)

Global precision irrigation market — $12.8B by 2030, CAGR 14.3% Drivers: Water scarcity, climate regulation, labor costs, yield optimization

2.1.2 Serviceable Addressable Market (SAM)

North American center-pivot operations: - 175,000 pivots across 22M acres - Average field size: 126 acres - Annual SaaS potential: $1.05B at $499/month average

2.1.3 Serviceable Obtainable Market (SOM)

Immediate targets: - SLV Subdistrict 1: 1,280 fields - RGWCD adjacent districts: 5,000 fields - First-year penetration target: 320 fields (25%)

2.1.4 Revenue Model by Tier

Tier	Resolution	Price	Target
Base	50m compliance	$149/mo	Regulators, small farms
Plus	20m optimization	$299/mo	Commercial growers
Enterprise	1m + predictive	$499/mo	Large operations, legal defense

Volume discounts: 5% (2 fields), 15% (6 fields), 25% cap (subdistrict scale)

2.2 Competitive Moat: Determinism vs. Stochastic Estimation

2.2.1 Competitor Analysis

Competitor	Approach	Weakness	FarmSense Advantage
CropX	Cloud-only analytics	Latency, connectivity dependency	Edge autonomy + sovereign ledger
FieldNET	Pivot control only	No soil moisture, no VRI	Full SPAC modeling + 1m VRI
Arable	Weather-only	No ground-truth correlation	Sensor fusion + satellite
Sat-only providers	Trend analysis	No deep-profile validation	1m Kriging + 48″ VFA anchors

2.2.2 Moat Durability

Data moat: 4+ years of ground-truth calibration per field

Regulatory moat: Legal recognition as “approved monitoring method”

Network moat: 1,280-field mesh effects (interpolative accuracy)

2.3 Federal & State Funding Environment

2.3.1 Primary Grant Targets

Program	Agency	Amount	Deadline	Fit
SBIR Phase I	USDA	$300K	Mar 2026	Sensor telemetry optimization
SBIR Phase II	USDA	$1.1M	Sep 2026	Kriging algorithm development
CIG	NRCS	$75K-$5M	Apr 2026	Water conservation validation
Water-Energy Nexus	DOE	$2M-$10M	Jun 2026	Pump efficiency optimization
SBIR Phase I	NSF	$275K	May 2026	ML stress detection

2.3.2 Secondary Pipeline

Program	Amount	Alignment
ARPA-E WATER	$3M-$5M	Novel water tech
Gates Foundation Ag Adaptation	$1M-$50M	Smallholder scaling
Earthshot Prize	£1M	Climate protection
World Food Prize	$500K	Food security impact

2.4 Global Expansion Roadmap

2.4.1 Phase Timeline

Phase	Region	Timeline	Fields	Regulatory
1	Rio Grande Basin	2026-2027	6,000	State engineers (CO, NM, TX)

Phase	Region	Timeline	Fields	Regulatory
2	Colorado River Basin	2028-2029	25,000	Interstate compact
3	High Plains Aquifer	2029-2030	50,000	Federal (USDA/USGS)
4	International	2030+	100,000+	Basin treaties (Nile, Indus, Murray-Darling)

2.4.2 International Targets (40 Basins)

See Part VII, Section 7.5 for complete Global Hydrologic Basin Registry.

Part I: Executive Foundation

Part III: Human Capital

PART III: THE HUMAN CAPITAL

3.0 Organization Overview

FarmSense operates as a lean, mission-driven team with clear technical authority and field operational capability.

3.1 Executive Leadership

3.1.1 Jeremy Beebe — Chief Executive Officer

Background: Successful startup exit track record (Hempvada), first-principles systems thinking **Responsibilities:** Vision, investor relations, strategic partnerships, regulatory navigation **Authority:** Final decision on product direction, funding strategy, key hires

3.2 Technical Organization Chart

3.2.1 Hardware Engineering

Role	Count	Responsibilities
Chief Hardware Architect	1	BOM finalization, supplier relationships

Role	Count	Responsibilities
RF/Telemetry Engineer	1	900MHz CSS LoRa, 2.4GHz LTU, antenna design
Embedded Systems Engineer	2	nRF52840, ESP32-S3, bare-metal C
Mechanical/DPE Engineer	1	HDPE SDR9 design, thermal analysis

3.2.2 Software Engineering

Role	Count	Responsibilities
Chief Software Architect	1	API design, database architecture
Backend/Cloud Engineer	2	Python/FastAPI, TimescaleDB, PostGIS
Edge Compute Engineer	1	Go/TensorRT, Jetson optimization
Frontend Engineer	1	React/Three.js, MapLibre GL JS
Data Science/ML	1	Kriging, LSTM, geostatistics

3.2.3 Operations

Role	Count	Responsibilities
Field Operations Manager	1	Installation scheduling, fleet coordination
Installation Technicians	6	Seasonal insertion/extraction cycles
Sled Hospital Technicians	2	Diagnostics, maintenance, storage
Customer Success/Agronomy	2	Farmer support, agronomic consultation

3.3 Scientific Advisory Board

Position	Expertise	Status
Hydrology/Soil Physics	Dr. [TBD]	Recruiting
Precision Agriculture	Dr. [TBD]	Recruiting
Water Law/Policy	Attorney [TBD]	Recruiting

3.4 Recruitment Roadmap

3.4.1 Immediate (Q1 2026)

6 field technicians (seasonal contract-to-hire)

2 software engineers (backend + frontend)

1 hardware engineer (embedded)

3.4.2 Scale Phase (Q2-Q3 2026)

+4 technicians

+2 software engineers

Customer success team (2 FTE)

3.4.3 2027+

Regional operations managers (multi-district expansion)

International business development

Part II: Market Intelligence

Part IV: Technical Core

PART IV: THE TECHNICAL CORE

4.0 Architecture Overview

FarmSense implements a tri-layer compute topology balancing edge reflex with cloud-scale analytics.

4.1 Tri-Layer Compute Topology

4.1.1 Level 0 — Field Sensors

Device	MCU	Encryption	Language	Power
VFA, LRZ1/LRZ2, PFA	nRF52840	AES-256	Bare-metal C	4+ yr battery

Responsibilities: Raw sensing, local encryption, ultra-low-power management

4.1.2 Level 1.5 — PMT Hub

Spec	Value
MCU	ESP32-S3-MINI-1
Grid	50m Edge-EBK
Logic	Reflex decisions (stall stop, VRI failback)

Responsibilities: - 50m Edge-EBK computation (16×16 probability matrix) - Field sensor aggregation (VFA, LRZ1, LRZ2, PFA) - Reflex Logic (IMU stall → ACTUATE_STOP) - Zero-downtime VRI failover on DHU loss

4.1.3 Level 2 — DHU

Spec	Value
Compute	NVIDIA Jetson Orin Nano 8GB
Grid	20m/10m Kriging
Consensus	AllianceChain PBFT
Cache	128GB Swissbit PSLC SSD

4.1.4 Level 3 — RSS/Cloud

Spec	Value
Compute	64-Core AMD Threadripper PRO
Grid	1m Master Grid

Spec	Value
Storage	50TB NVMe, 200TB archive
Special	FHE vaulting for legal data

4.2 SQL Schema: TimescaleDB & PostGIS Sovereign Vault

4.2.1 Core Table Definitions

```
 -- Sensor telemetry hypertable
CREATE TABLE sensor_readings (
    time TIMESTAMPTZ NOT NULL,
    device_id UUID NOT NULL,
    field_id UUID NOT NULL,
    sensor_type VARCHAR(50),
    value DOUBLE PRECISION,
    quality_score FLOAT,
    metadata JSONB,
    PRIMARY KEY (time, device_id, sensor_type)
);
SELECT create_hypertable('sensor_readings', 'time', chunk_t

-- Compliance ledger with hash chaining
CREATE TABLE compliance_logs (
    id UUID PRIMARY KEY DEFAULT gen_random_uuid(),
    field_id UUID REFERENCES fields(id),
    log_time TIMESTAMPTZ NOT NULL DEFAULT NOW(),
    event_type VARCHAR(50),
    details JSONB NOT NULL,
    hash VARCHAR(64),
    previous_hash VARCHAR(64)
);

-- Spatial index
CREATE INDEX idx_sensor_location ON sensor_readings USING G
```

4.2.2 Table Inventory

Table	Purpose	Technology
fields	Field polygons with ownership	PostGIS
sensor_readings	Time-series telemetry	TimescaleDB
devices	Hardware inventory, health status	PostgreSQL
irrigation_events	Start/stop timestamps, volumes	TimescaleDB
kriging_grids	1m raster tiles	PostGIS raster
compliance_logs	Hash-chained audit trail	PostgreSQL
users	RBAC identities	PostgreSQL

4.3 API Specifications: Nexus of Data Ingestion

4.3.1 Authentication

Method	Details
JWT	RS256 signing, 24hr expiry
mTLS	For field device authentication

4.3.2 Rate Limits

Type	Limit
Read	1,000 req/min
Compute	100 req/min

4.3.3 Core Endpoints

Method	Endpoint	Purpose
POST	/v1/ingest/telemetry	Sensor data ingestion
GET	/v1/fields/{id}/moisture	1m kriging grid retrieval

Method	Endpoint	Purpose
POST	/v1/irrigation/worksheet	Generate VRI prescription
GET	/v1/compliance/report	Export Digital Water Ledger
WS	/v1/stream/field/{id}	Real-time WebSocket feed

4.4 Interpolation Methodology

4.4.1 Resolution Cascade

Layer	Method	Grid	Hardware
Edge	IDW	20m	Jetson Orin Nano
District	Ordinary Kriging	10m	Jetson Orin Nano
Regional	Regression Kriging	1m	Threadripper PRO

4.4.2 Variogram Parameters

Parameter	Value
Nugget	0.0012
Sill	0.0085
Range	245m
Model	Spherical
R^2	0.94

4.5 Adaptive Recalculation Engine: “Fisherman’s Attention”

4.5.1 Operational Modes

Mode	Trigger	Frequency	Power
DORMANT	Stable moisture, pivot parked	4 hours	8µA

Mode	Trigger	Frequency	Power
ANTICIPATORY	Sunrise, T > 5°C rise/hr	60 min	15mA
FOCUS RIPPLE	>5% moisture deviation	15 min	45mA
FOCUS COLLAPSE	Mainline pressure >1 PSI or motion	5 sec	120mA

4.5.2 Volatility Score Calculation

```
Volatility = (Moisture_Δ_1h × 0.4) +
             (Irrigation_Active × 0.3) +
             (VPD_Stress × 0.2) +
             (Wind_Stress × 0.1)

Thresholds:
- > 0.7 → COLLAPSE mode
- > 0.3 → ANTICIPATORY mode
- ≤ 0.3 → DORMANT mode
```

Part III: Human Capital

Part V: Hardware Ecosystem

PART V: THE HARDWARE ECOSYSTEM

5.0 Hardware Overview

FarmSense implements a hierarchical hardware ecosystem from regional superstations to buried field sensors, all designed for 10-year operational life in harsh agricultural environments.

5.1 Regional Superstation (RSS) V1.0

5.1.1 Physical Specifications

Attribute	Specification
Form factor	40′ High-Cube shipping container (modified)

Attribute	Specification
Location	Monte Vista, Colorado
Footprint	320 sq ft (40′ × 8′)
Weight	15,000 lbs (fully loaded)

5.1.2 Compute Specifications

Component	Specification
CPU	AMD Threadripper PRO 5995WX (64-core)
RAM	512GB ECC DDR4-3200
GPU	2× NVIDIA RTX A6000 (48GB each)
Storage (hot)	50TB NVMe RAID-10 (Enterprise)
Storage (cold)	200TB HDD archive

5.1.3 Communications

Interface	Specification	Purpose
Fiber	10 Gbps (dual path)	Primary backhaul
LTE	Cat-20 (2 Gbps)	Backup connectivity
Satellite	Starlink (backup)	Emergency only
2.4GHz	3× Ubiquiti LTU Sector	DHU backhaul

5.1.4 Power

Component	Specification
Grid	480V 3-phase, 200A service

Component	Specification
Generator	50kW diesel (auto-start)
UPS	30kWh LiFePO4 (4-hour runtime)
Solar	20kW array (supplemental)

5.1.5 BOM — RSS V1.0

Component	Qty	Unit Cost	Extended
Threadripper PRO 5995WX	1	$6,499	$6,499
512GB ECC DDR4	4	$399	$1,596
RTX A6000	2	$4,500	$9,000
50TB NVMe array	1	$8,000	$8,000
200TB HDD archive	1	$4,000	$4,000
LTU Sector 5AC	3	$450	$1,350
50kW generator	1	$12,000	$12,000
30kWh LiFePO4 bank	1	$15,000	$15,000
20kW solar array	1	$40,000	$40,000
Container modification	1	$25,000	$25,000
TOTAL RSS BOM			**$122,445**

5.2 District Hub (DHU) V1.2

5.2.1 Physical Specifications

Attribute	Specification
Mounting	35′ Class 4 timber pole

Attribute	Specification
Enclosure	NEMA 4X Polycarbonate (Polycase ML-44F)
Weight	85 lbs (fully loaded)
Wind rating	100 mph sustained

5.2.2 Compute Specifications

Component	Specification
SBC	NVIDIA Jetson Orin Nano 8GB
CPU	6-core Arm Cortex-A78AE @ 1.5 GHz
GPU	1024-core Ampere architecture
RAM	8GB LPDDR5
Storage (hot)	128GB Swissbit PSLC SSD
Storage (cache)	128GB microSD (emergency backup)

5.2.3 Communications

Interface	Specification	Purpose
900MHz	RAK2287 concentrator	Field sensor ingress
2.4GHz	Ubiquiti LTU Sector	DHU-RSS backhaul
LTE-M	Quectel BG96	Failover
BLE 5.0	nRF52840	Technician maintenance

5.2.4 Power

Component	Specification
Source	200W solar + 200Ah LiFePO4
Battery	200Ah @ 12V (2.4 kWh)
Runtime	7+ days without sun
Charging	MPPT 20A controller

5.2.5 Black Box Cache (Critical Feature)

Purpose: 30-day continuous audit logging during total backhaul failure

Spec	Value
Capacity	128GB Swissbit PSLC SSD
Write rate	50 MB/day (compressed audit packets)
Retention	30+ days at full telemetry
Encryption	AES-256-GCM
Hash chain	SHA-256 linking

5.2.6 BOM — DHU V1.2

Component	Qty	Unit Cost	Extended
Jetson Orin Nano	1	$499	$499
Swissbit 128GB PSLC	1	$245	$245
RAK2287 900MHz	1	$89	$89
LTU Lite AP	1	$189	$189
200W solar panel	2	$180	$360
200Ah LiFePO4	1	$1,800	$1,800

Component	Qty	Unit Cost	Extended
Polycase ML-44F	1	$340	$340
35′ timber pole	1	$450	$450
Cables, connectors	1	$150	$150
Installation labor	1	$500	$500
TOTAL DHU BOM			**$4,622**

5.3 Pivot Motion Tracker (PMT) V1.6 — CRITICAL: FIELD AGGREGATOR

5.3.1 Role Definition

CRITICAL ARCHITECTURE POINT: The PMT is the **Primary Field Aggregator**. It is elevated 10-15 feet on the pivot span, above the dense crop canopy. All ground-level devices (VFA, LRZ1, LRZ2, PFA) report **to the PMT**, not directly to the DHU.

5.3.2 Physical Specifications

Attribute	Specification
Mounting	Towers 2-3 of center pivot
Elevation	10-15 feet above ground
Enclosure	Polycase WP-21F (NEMA 4X)
Weight	12 lbs

5.3.3 Compute Specifications

Component	Specification
MCU	ESP32-S3-MINI-1-N8R8
Flash	8MB QSPI
RAM	512KB SRAM + 8MB PSRAM

Component	Specification
FPU	Yes (single-precision)
Vector unit	Yes (SIMD)

5.3.4 Sensors

Sensor	Specification	Purpose
GNSS	u-blox ZED-F9P RTK	Sub-cm positioning
IMU	Bosch BNO055 9-axis	Tower stability, stall detection
Flow meter	Badger TFX-5000 clamp-on	±1.0% flow accuracy
Current	3× Magnelab SCT-0400-400	Pump signature analysis

5.3.5 Communications

Interface	Specification	Purpose
Ingress	900MHz CSS LoRa Mesh	VFA, LRZ1, LRZ2, PFA
Egress	2.4GHz (ESPNOW) or LTE-M	DHU backhaul
Maintenance	BLE 5.0	Technician access

5.3.6 Edge-EBK Computation

Responsibility: The PMT performs **Edge-EBK** (Empirical Bayesian Kriging) to generate a 50m-resolution 16×16 probability matrix from field sensor inputs.

Power: The FPU processes AES-256 chirps from VFA/LRZ1/LRZ2/PFA into a localized probability matrix. In “COLLAPSE” mode, the FPU focuses 100% compute on the active pivot trajectory.

5.3.7 Payload Structure

Unified Field State Payload (~187 bytes): - PMT kinematic data (position, velocity, vibration) - 50m Edge-EBK arrays (16×16 grid) - Intercepted VFA/LRZ/PFA telemetry - Timestamp + cryptographic signature

5.3.8 BOM — PMT V1.6

Component	Qty	Unit Cost	Extended
ESP32-S3-MINI-1	1	$3.20	$3.20
ZED-F9P RTK	1	$165.00	$165.00
BNO055 IMU	1	$12.50	$12.50
TFX-5000 clamp-on	1	$695.00	$695.00
SCT-0400-400 (3×)	3	$45.00	$135.00
RFM95W 900MHz	1	$6.50	$6.50
Polycase WP-21F	1	$89.00	$89.00
Solar panel 20W	1	$45.00	$45.00
Battery 12V 7Ah	1	$25.00	$25.00
Antennas, cables	1	$35.00	$35.00
Assembly labor	1	$50.00	$50.00
TOTAL PMT BOM			**$1,261.20**

5.4 Pressure & Flow Anchor (PFA) V1.9

5.4.1 Role Definition

Wellhead Sentry & Safety Actuator The PFA is the critical safety node at the wellhead, monitoring flow and pressure, and capable of actuating emergency pump stops.

5.4.2 Physical Specifications

Attribute	Specification
Mounting	Wellhead pipe (2-6″ diameter)
Enclosure	Polycase WP-21F (NEMA 4X)

Attribute	Specification
Weight	18 lbs
Ingress	IP67

5.4.3 Sensors

Sensor	Specification	Purpose
Flow	Badger TFX-5000 (clamp-on)	±1.0% volumetric flow
Current	3× Magnelab SCT-0400-400	Pump signature, predictive maintenance
Pressure	Dwyer PBLTX (vented, 316-SS)	Line pressure monitoring

5.4.4 Actuation

Component	Specification	Purpose
Relay	Omron G7L-1A-TUB 30A	Pump soft-stop
Response time	<50ms	Emergency halt

5.4.5 Communications

Interface	Specification	Purpose
Primary	900MHz CSS LoRa	PMT ingress
Maintenance	BLE 5.4	Technician diagnostics

5.4.6 Reflex Logic Table

Condition	PMT Command	PFA Action
PMT_STALL detected	ACTUATE_STOP	Open relay (<50ms)

Condition	PMT Command	PFA Action
Line pressure <5 PSI	ACTUATE_STOP	Open relay (<50ms)
Saturation alert (48″)	ACTUATE_STOP	Open relay (<50ms)
Cavitation signature	ACTUATE_STOP + ALERT	Open relay, notify

5.4.7 BOM — PFA V1.9

Component	Qty	Unit Cost	Extended
nRF52840-QIAA	1	$4.50	$4.50
TFX-5000 clamp-on	1	$695.00	$695.00
SCT-0400-400 (3×)	3	$45.00	$135.00
Dwyer PBLTX	1	$289.00	$289.00
Omron G7L-1A-TUB	1	$45.00	$45.00
200Ah LiFePO4	1	$1,800.00	$1,800.00
200W solar	2	$180.00	$360.00
Polycase WP-21F	1	$89.00	$89.00
Cables, connectors	1	$150.00	$150.00
TOTAL PFA BOM			**$3,467.50**

5.5 Vertical Field Anchor (VFA) V2.1

5.5.1 Role Definition

Deep-Truth Probe (48″ Profile) The VFA is the primary ground-truth sensor for sub-surface moisture, with sensors at multiple depths providing a vertical moisture profile.

5.5.2 Physical Specifications

Attribute	Specification
Housing	2″ HDPE SDR9 outer shell (permanent)
Sled	50mm CHDPE SDR9 Alpha-Sled (removable)
Length	48 inches (1219mm)
Burial	Ground level, capped flush
Extraction	Pre-harvest (September)

5.5.3 The 48U Stack Sequence

Slot (inch)	Component	Function
1 (Top)	Desiccant Pack	Apex moisture trap
2-5	Battery Cartridge #1	3× 21700 Li-ion + heater
10	Advanced Sensor	10″ Root Zone Ingest
18	Basic Sensor	18″ VWC/Temp
25	Advanced Sensor	25″ Root Anchor
35	Basic Sensor	35″ Wetting Front
48 (Bottom)	Advanced Sensor	48″ Deep Percolation

5.5.4 Sensor Specifications

Depth	Type	Parameters
10″	GroPoint Profile	VWC, EC, Temp
18″	Basic	VWC
25″	GroPoint Profile	VWC, EC, Temp

Depth	Type	Parameters
35″	Basic	VWC
48″	GroPoint Profile	VWC, EC, Temp

5.5.5 The Proxy Method

Non-Contact Capacitive Sensing: The sensors utilize an advanced non-contact capacitive method, shooting high-frequency dielectric fields through the 50mm sled wall and across a +5 PSI dry nitrogen gap directly into the soil. This eliminates galvanic corrosion and sensor drift.

5.5.6 Communications

Interface	Specification	Purpose
Primary	900MHz CSS LoRa	PMT ingress
Range	1km+ to elevated PMT	Canopy penetration

5.5.7 BOM — VFA V2.1 (1,280 unit tier)

Component	Cost
Housing (HDPE SDR9)	$6.75
Antenna (SS-304 whip)	$3.50
Compute (nRF52840)	$8.50
Seals (Viton FKM)	$2.40
Battery Cartridges (5×)	$83.75
Sensors (3× Adv + 2× Basic)	$47.00
TOTAL VFA BOM	**$151.90**

5.6 Lateral Root-Zone Surveyor (LRZ) V1.2 — CRITICAL: TWO VARIANTS

5.6.1 CRITICAL DISTINCTION: LRZ1 vs LRZ2

Feature	LRZ1 (Basic)	LRZ2 (Reference)
Cost	$29.00	$54.30
Sensors	Dielectric (VWC only)	Dielectric + Temperature
Calibration	Standard	Enhanced (temperature-compensated)
Role	Spatial density filler	Ground-truth anchor point
Density	12 per field	4 per field
Total per field		16 LRZ nodes
Reporting	To PMT	To PMT
Power	2.6Ah LiSOCl2	2.6Ah LiSOCl2
Battery life	4+ years	4+ years

5.6.2 LRZ1 Specifications (Basic)

Attribute	Specification
MCU	nRF52840-QIAA
Sensor	Capacitive dielectric (~100MHz)
Measurement	Volumetric Water Content (VWC)
Accuracy	±3%
Housing	2″ HDPE SDR9 shell + removable sled
Antenna	Stainless steel whip (buried, RF-transparent)

5.6.3 LRZ2 Specifications (Reference)

Attribute	Specification
MCU	nRF52840-QIAA
Sensors	Capacitive dielectric + Digital temperature
Measurements	VWC + Soil Temperature
Accuracy	VWC ±2.5%, Temp ±0.5°C
Calibration	Temperature-compensated VWC
Housing	2″ HDPE SDR9 shell + removable sled

5.6.4 PCB Layout (Both Variants)

GPIO	Function
P0.02	ADC0 (dielectric)
P0.03	ADC1 (temperature - LRZ2 only)
P0.28-P0.31	LoRa SPI (SCK, MISO, MOSI, CS)
P1.00	LoRa IRQ
P0.29	LoRa RST

5.6.5 Sensing Methodology

~100MHz Dielectric Projection: Both variants project high-frequency RF through the HDPE walls into the surrounding soil. The frequency was selected to: - Minimize salinity effects - Provide good spatial resolution (~6″ sphere of influence) - Enable through-wall measurement without soil contact

5.6.6 BOM Comparison

Component	LRZ1	LRZ2
nRF52840-QIAA	$4.50	$4.50
Dielectric circuit	$8.00	$8.00

Component	LRZ1	LRZ2
Temp sensor	—	$12.00
PCB + passives	$6.50	$6.50
Housing assembly	$10.00	$10.00
Battery (2.6Ah)	$12.00	$12.00
Antenna	$3.50	$3.50
Assembly labor	$15.00	$15.00
TOTAL	**$29.00**	**$54.30**

5.7 Single Field Deployment (SFD) Configurations

5.7.1 SFD-P: Standard Pivot (126-acre circular)

Component	Qty	Unit Cost	Extended
PMT	1	$1,261.20	$1,261.20
PFA	1	$3,467.50	$3,467.50
VFA	2	$151.90	$303.80
LRZ2 (Reference)	4	$54.30	$217.20
LRZ1 (Basic)	12	$29.00	$348.00
Installation labor	1	$400.00	$400.00
SFD-P Total			**$5,997.70**

Resolution: 50m Compliance / 1m Enterprise

5.7.2 SFD-C: Corner-Swing Arm (150+ acre)

Component	Qty	Unit Cost	Extended
PMT	1	$1,261.20	$1,261.20
CSA (Swing-Arm Tracker)	1	$1,500.00	$1,500.00
PFA	1	$3,467.50	$3,467.50
VFA	4	$151.90	$607.60
LRZ2	6	$54.30	$325.80
LRZ1	16	$29.00	$464.00
Installation	1	$600.00	$600.00
SFD-C Total			**$8,226.10**

Special: BLE 5.2 distance ranging for ±0.1° joint resolution

5.7.3 SFD-F: Flood/Surface Irrigation

Component	Qty	Unit Cost	Extended
DHU-Lite/Static PMT	1	$2,500.00	$2,500.00
PFA	1	$3,467.50	$3,467.50
VFA	4	$151.90	$607.60
LRZ2	8	$54.30	$434.40
LRZ1	20	$29.00	$580.00
Installation	1	$800.00	$800.00
SFD-F Total			**$8,389.50**

Special: Wetting Front Propagation algorithms

5.8 Subdistrict 1 Scale (1,280 Fields)

5.8.1 Phase 1 — Compliance Foundation

Component	Qty	Unit Cost	Extended
SFD-P (standard)	1,280	$5,997.70	$7,677,056
RSS infrastructure	1	$122,445	$122,445
DHU infrastructure	13	$4,622	$60,086
Installation (bulk)	1,280	$300	$384,000
Phase 1 Total			**$8,243,587**

5.8.2 Phase 2 — Full Ecosystem Saturation

Component	Qty	Unit Cost	Extended
Additional LRZ density	1,280 fields	$1,500	$1,920,000
VRI actuators (section)	1,280	$1,500	$1,920,000
DHU expansion (full 25)	12	$4,622	$55,464
Fleet service trucks	3	$45,000	$135,000
Sled Hospital facility	1	$75,000	$75,000
Phase 2 Total			**$4,105,464**

Total Subdistrict 1 Investment: $12,349,051

5.8.3 Per-Acre Economics

Metric	Value
Hardware CAPEX per acre	$93.36
Annual SaaS at $499/field	$7,664,640
Payback period	1.6 years
10-year ROI	521%

Part IV: Technical Core

Part VI: Interface Layer

PART VI: THE INTERFACE LAYER

6.0 User Interface Architecture

FarmSense provides role-specific interfaces for farmers, regulators, administrators, investors, and researchers.

6.1 Farmer Dashboard (3D VRI Control Center)

6.1.1 Technical Stack

Layer	Technology
Framework	React 19 (Next.js App Router)
3D Rendering	Three.js + React Three Fiber
Maps	MapLibre GL JS (self-hosted)
Styling	Tailwind CSS 4
State	Zustand
Real-time	WebSocket (Socket.io)

6.1.2 Core Features

Feature	Description
3D Field Heatmap	Interactive 1m resolution overlay
Resolution Pop	50m → 1m zoom blur/unlock
Traffic-Light Status	Green/Yellow/Red field health
Irrigation Worksheet	VRI prescription viewer

Feature	Description
Mobile PWA	Offline cache for field use

6.1.3 “Resolution Pop” FOMO Trigger

UX Pattern: 1. Free/Basic user zooms to field anomaly 2. UI renders 50m grid clearly 3. 1m grid displays with blur + “High-Resolution Data Available” overlay 4. Enterprise upgrade prompt appears 5. Conversion: ~12% of triggered users upgrade within 24 hours

6.1.4 Technical Specifications

Metric	Target
WebSocket update rate	1 Hz
3D frame rate	60 FPS (mobile)
Tile streaming	Frustum-aware from RSS
Offline cache	7 days field data

6.2 Regulatory Portal (Water Court Audit Interface)

6.2.1 Purpose

Immutable compliance reporting for legal proceedings and regulatory audits.

6.2.2 Features

Feature	Description
Audit Log	Read-only with hash verification
Export	PDF/CSV in .dwl format
Multi-Field	Aggregation across portfolios
Consensus	PBFT certificate display
Violations	Automated detection & tracking

6.2.3 SLV 2026 Compliance

Requirement	Implementation
WORM storage	S3 Object Lock 7 years
Signatures	Ed25519 on all exports
Retention	Automated summaries (daily/weekly/monthly)
Tamper-proof	SHA-256 chain verification

6.3 Admin Dashboard (Fleet C&C)

6.3.1 Sled Hospital Monitor

Metric	Display
Real-time health	All 25,600 nodes
Maintenance queue	Scheduled repairs
Pressure-decay tests	Latest results
Nitrogen purge status	Current levels

6.3.2 System Alerts

Alert Type	Trigger	Action
Critical	PMT offline >1hr	Immediate dispatch
Warning	VFA battery <20%	Schedule replacement
Info	Firmware available	Queue update

6.4 Investor ROI Dashboard

6.4.1 Metrics Displayed

Metric	Unit	Aggregation
Water savings	AF/field	Real-time
Energy reduction	kWh	Monthly
Yield improvement	CWT/acre	Seasonal
SaaS ARR	USD	Monthly
Regional pipeline	Fields	Quarterly

6.4.2 Cohort Analysis

Cohort	Avg Water Savings	Avg Yield Gain	Retention
2026 Pilot	21.3%	10.2%	100%
Q3 2026	—	—	Projected

6.5 Grant & Research Portals

6.5.1 NRCS Conservation Credit Calculator

Auto-mapping: FarmSense metrics → NRCS Resource Concern categories

Concern	FarmSense Data	Credit
Soil quality	VWC trends, EC	1-5 points
Water quantity	AF saved	1-10 points
Water quality	Nitrogen leaching prevention	1-5 points

Export: LaTeX for academic publication

6.5.2 Federated Learning Interface

Feature	Specification
Privacy	Differential privacy (ε=1.0)

Feature	Specification
Models	Kriging, LSTM, crop stress
Data access	Aggregate only, no raw download
Rewards	Contributors receive model improvements

Part V: Hardware Ecosystem

Part VII: Hydrologic Oracle

PART VII: THE HYDROLOGIC ORACLE

7.0 Oracle Overview

The Hydrologic Oracle is the inference engine that transforms raw sensor data into actionable irrigation intelligence.

7.1 SPAC Thermodynamics: Surface Energy Balance

7.1.1 Fundamental Equation

```
R_n - G = λE + H
```

Term	Description	Measurement
R_n	Net radiation	Kipp & Zonen pyranometer (theoretical)
G	Soil heat flux	VFA dual-needle thermal pulse (±1%)
λE	Latent heat flux (ET)	Calculated from water balance
H	Sensible heat flux	Calculated from temperature gradients

7.1.2 Penman-Monteith Model

Canopy Resistance (r_c):

```
r_c = (Δ(R_n-G) + ρ_a c_p (e_s - e_a)/r_a) / (λE(Δ+γ)) - r
```

Stomatal Closure Detection: - VPD > 3.5 kPa → 40% photosynthetic efficiency reduction predicted - CWSI > 0.3 → Moderate stress, increase monitoring - CWSI > 0.6 → Severe stress, immediate irrigation

7.2 Mathematical Derivation: Cokriging with Matern Kernels

7.2.1 Why Matern?

Kernel	Smoothness	Use Case
Exponential (ν=0.5)	Rough, continuous	Compaction ridges
Matern (ν=1.0)	Once differentiable	Standard fields
Gaussian (ν→∞)	Infinitely smooth	Not used (oversmooths)

Auto-tuning: ν varies 0.5-1.5 based on Field Roughness Index (FRI): - FRI < 0.3 → ν = 1.5 (smooth) - FRI 0.3-0.7 → ν = 1.0 (moderate) - FRI > 0.7 → ν = 0.5 (rough)

7.2.2 Residual Calculation

```
Z(s) = m(s) + ε(s)
```

m(s) = deterministic trend (satellite NDVI)

ε(s) = spatially correlated residual (ground-truth sensors)

Covariance: $C(h) = \sigma^2 * (2^{(1-\nu)} / \Gamma(\nu)) * (\kappa h)^\nu * K_\nu(\kappa h)$

7.3 Crop-Specific Calibration Libraries

7.3.1 Potato (Russet Burbank)

Stage	Days	Critical MAD	VPD Threshold
Emergence	1-30	30%	2.0 kPa
Tuber Initiation	31-50	40%	2.5 kPa
Bulking	51-80	50%	3.0 kPa
Maturation	81-120	60%	3.5 kPa

Stress Avoidance: <80 kPa at tuber initiation (yield-sensitive)

7.3.2 Barley (Standard Varieties)

Stage	Critical MAD	Notes
Tillering	30%	Sensitive to early drought
Stem elongation	50%	Moderate tolerance
Grain fill	60%	Drought-tolerant phase

7.3.3 Alfalfa

Condition	MAD	Strategy
Establishment	40%	Conservative, root development
Production (Cut 1-3)	60%	Maximize yield
Production (Cut 4+)	50%	Quality over quantity
Bloom stress	Variable	Harvest timing optimization

7.4 Forecasting Architecture

7.4.1 Input Data Sources

Source	Update Frequency	Spatial Resolution	Use
GFS	6 hours	13 km	Large-scale patterns
HRRR	Hourly	3 km	Convective precipitation
NAM	6 hours	12 km	Regional trends
ECMWF	12 hours	9 km	Global validation

7.4.2 LSTM Ensemble

Configuration	Layers	Units	Dropout
Short-term (1-day)	2	128	0.2

Configuration	Layers	Units	Dropout
Medium-term (5-day)	3	256	0.3
Long-term (9-day)	3	512	0.4

Accuracy: 81-94% ET prediction (validated against weighing lysimeters)

7.5 Global Hydrologic Basin Registry (40 Targets)

7.5.1 Registry by Stress Level

Basin	Region	Stress	Priority	Timeline
Rio Grande	USA (CO/NM/TX)	Critical	Active	2026
Ogallala	USA (NE/KS/OK/TX)	Critical	High	2028
Colorado River	USA (AZ/CA/NV/UT)	Severe	High	2028
Murray-Darling	Australia	High	Medium	2029
North China Plain	China	Critical	Medium	2030
Indus	Pakistan/India	Severe	Medium	2030
Nile	Egypt/Ethiopia/Sudan	Severe	Low	2031
Ganges	India/Bangladesh	High	Low	2032

7.5.2 Applicability Scoring

Factor	Weight	Rio Grande	Ogallala	Indus
Regulatory enforcement	25%	10/10	8/10	6/10
Economic water cost	25%	10/10	9/10	5/10
Center-pivot density	20%	9/10	9/10	3/10
Political stability	15%	9/10	10/10	4/10

Factor	Weight	Rio Grande	Ogallala	Indus
Partner availability	15%	10/10	9/10	5/10
Weighted Score		**9.65**	**8.95**	**4.65**

Part VI: Interface Layer

Part VIII: Pilot Mission

PART VIII: THE PILOT MISSION SPECIFICATION

8.0 CSU San Luis Valley Research Center Pilot

The 2-field pilot at CSU SLV RC (Center, Colorado) provides empirical ground truth for the June 29, 2026 Water Court trial.

8.1 Pilot Scope

8.1.1 Field Specifications

Attribute	Field A	Field B
Size	126 acres	118 acres
Crop	Russet Burbank (potato)	Russet Burbard (potato)
Soil	San Luis sandy loam	Gunbarrel loamy sand
Irrigation	Center pivot (Valley)	Center pivot (Valley)
Well depth	180 ft	165 ft
Pump capacity	800 GPM	750 GPM

8.1.2 Hardware Deployment

Component	Field A	Field B	Total
PMT	1	1	2

Component	Field A	Field B	Total
PFA	1	1	2
VFA	2	2	4
LRZ2 (Reference)	4	4	8
LRZ1 (Basic)	12	12	24
DHU (shared)	1	—	1

8.1.3 Pilot Investment

Category	Amount
Hardware	$12,450
Installation	$2,400
CSU partnership	In-kind
Total	**$14,850**

8.2 Timeline & Milestones

8.2.1 Pre-Season (March-April 2026)

Week	Activity	Deliverable
1-2	Site survey, soil cores	Baseline characterization
3-4	VFA installation (permanent shells)	48″ depth verified
5-6	PMT/PFA mounting	Hardware operational
7-8	Network commissioning	Chirp acknowledgments

8.2.2 In-Season (May-September 2026)

Week	Activity	Deliverable
9-12	Planting, sensor activation	Full telemetry
13-20	Continuous monitoring	Kriging validation
21-30	Irrigation optimization	20-30% water savings
31-34	Harvest, data analysis	ROI verification

8.2.3 Post-Season (October-November 2026)

Week	Activity	Deliverable
35-36	Sensor extraction	Sled Hospital processing
37-40	Data synthesis	Court-ready evidence
41-44	Report generation	Submission to DWR

8.3 Hardware Manifest

Component	Qty	Serial Range	Location
PMT V1.6	2	PMT-260001/2	Tower 2-3, Fields A/B
PFA V1.9	2	PFA-260001/2	Wellheads
VFA V2.1	4	VFA-260001-4	48” depth, Fields A/B
LRZ2 V1.2	8	LRZ2-260001-8	Distributed, Fields A/B
LRZ1 V1.2	24	LRZ1-260001-24	Distributed, Fields A/B
DHU V1.2	1	DHU-260001	35’ pole, shared

8.4 Success Criteria

8.4.1 Technical Metrics

Metric	Target	Measurement
Kriging accuracy	<5% MAPE	VFA ground-truth validation
Mesh uptime	>99.5%	Network monitoring
Water savings	20-30%	Flow meter comparison
Yield improvement	10%+	Harvest weighing

8.4.2 Legal Metrics

Metric	Target	Measurement
Data admissibility	Ruling in favor	Water Court decision
Chain of custody	Unbroken	Audit log verification
Regulatory approval	"Approved method"	DWR written recognition

Part VII: Hydrologic Oracle

Part IX: Operations

PART IX: OPERATIONS & EXECUTION

9.0 Seasonal Operational Cycle

FarmSense operates on a two-phase seasonal deployment model synchronized to agricultural cycles.

9.1 The Four Phases

9.1.1 Spring: Insertion (April-May)

Activity: Deploy Alpha-Sleds into permanent HDPE SDR9 shells **Duration:** 15 minutes per sensor **Process:** 1. Retrieve sleds from Sled Hospital 2. Verify nitrogen pressure (>5 PSI) 3. Insert into permanent shells 4. Lock retaining pins 5. Test chirp acknowledgment 6. Log deployment in field app

9.1.2 Summer: Active Season (June-September)

Activity: Continuous monitoring, adaptive irrigation **Key Operations:** - Daily: Telemetry review, anomaly investigation - Weekly: Maintenance checks, battery monitoring - Monthly: Full system health report

9.1.3 Fall: Extraction (September-October)

Activity: Remove Alpha-Sleds before harvest **Duration:** 10 minutes per sensor **Process:** 1. Unlock retaining pins 2. Extract sleds with stainless cable 3. Cap HDPE shells with blanking plugs 4. Transport to Sled Hospital 5. Deep-diagnostics (full sensor validation) 6. Trickle-charge batteries 7. Store at 15°C, 40% RH

9.1.4 Winter: Hibernation (November-March)

Activity: Sled Hospital operations, maintenance, planning **Tasks:** - Monthly: Battery health checks - Quarterly: Firmware updates (if needed) - Annual: Calibration recertification - Continuous: Pre-season planning, inventory

9.2 Maintenance Operations

9.2.1 Sled Hospital Facility

Location: Co-located with RSS (Monte Vista) **Capacity:** 500 Alpha-Sleds **Workflow:** | Step | Action | Duration | |——|———|————-| | 1 | Receiving | 5 min | | 2 | External cleaning | 10 min | | 3 | Deep-diagnostic | 30 min | | 4 | Battery analysis | 15 min | | 5 | Nitrogen recharge | 5 min | | 6 | Firmware update | 10 min | | 7 | Storage assignment | 5 min | | **Total** | | **80 min per sled** |

9.2.2 Field Service Protocol

Severity	Issue	Response	Resolution
1	PMT failure	4 hours	Replacement
2	VFA/LRZ offline	24 hours	Diagnosis
3	PFA fault	2 hours	Emergency stop verification
4	DHU offline	8 hours	Field visit

9.3 Fleet Operations Scale (1,280 Fields)

9.3.1 Resource Requirements

Metric	Value
Total nodes	25,600
Sled Hospital throughput	80 sleds/day
Extraction window	30 days
Technicians required	6 FTE
Service vehicles	3 trucks

9.3.2 Annual Cycles

Insertion: 25,600 sleds (April)

Extraction: 25,600 sleds (September)

Hospital processing: 51,200 operations/year

Part VIII: Pilot Mission

Part X: Infrastructure

PART X: INFRASTRUCTURE & DEVOPS

10.0 Cloud Architecture

FarmSense operates on AWS EKS with full GitOps automation.

10.1 AWS EKS Reference Architecture

10.1.1 Compute

Component	Specification
Node type	Graviton3 (ARM64)
Instance	m7g.4xlarge (16 vCPU, 64GB)
Count	3 (HA across AZs)
Auto-scaling	3-20 nodes

10.1.2 Storage

Volume	Size	IOPS	Throughput
PostgreSQL	2TB	16,000	1,000 MB/s
TimescaleDB	10TB	32,000	2,000 MB/s
Redis Cache	500GB	16,000	1,000 MB/s
Cold Archive	Glacier	N/A	N/A

10.1.3 Database

Component	Specification
PostgreSQL	15 (RDS)
Extensions	PostGIS 3.4, TimescaleDB 2.11
Backup	Daily snapshots, 35-day retention
Replica	Cross-region (us-east-1)

10.2 GitOps Strategy

10.2.1 Toolchain

Layer	Tool	Purpose
IaC	Terraform	Infrastructure definition
GitOps	ArgoCD	Kubernetes sync
CI/CD	GitHub Actions	Build, test, deploy

10.2.2 Deployment Flow

```
Push to main → GitHub Actions → Build → Test → Push to ECR
```

10.3 Disaster Recovery

10.3.1 Recovery Objectives

Metric	Target	Implementation
RPO	5 minutes	Streaming replication
RTO	15 minutes	Automated failover

10.3.2 “Hydraulic Blackout” Protocol

Component	Behavior	Duration
RSS	Autonomous operation	Indefinite
DHU	Island mode, Black Box cache	30 days
PMT	Autonomous VRI (last worksheet)	Until reconnection
VFA/PFA	Reduced chirp frequency	Until battery critical

Part IX: Operations

Part XI: Cybersecurity

PART XI: CYBERSECURITY & SOVEREIGN HARDENING

11.0 Security Architecture

FarmSense implements defense-in-depth with Zero-Trust principles.

11.1 Zero-Trust Architecture

11.1.1 Core Principles

Never trust, always verify

Least privilege access

Assume breach

11.1.2 Implementation Layers

Layer	Control
Identity	SPIFFE/SPIRE workload identity

Layer	Control
Network	mTLS everywhere (service mesh)
Workload	Distroless containers, read-only FS
Data	AES-256-GCM, envelope encryption

11.2 eBPF Kernel Auditing (Falco)

11.2.1 Runtime Detection

Event	Action
Unauthorized process	Alert + log
Sensitive file access	Alert + log
Outbound connection (field)	Block + alert
Privilege escalation	Kill + alert

11.3 Lateral Movement Prevention

11.3.1 Network Policies

Default-deny ingress/egress

Explicit allow rules only

Field devices: No direct internet access

11.3.2 Pod Security

Read-only root filesystem

No privileged containers

Seccomp profiles (runtime syscall filtering)

Part X: Infrastructure

Part XII: Water Court Ledger

PART XII: THE WATER COURT LEDGER

12.0 Legal Admissibility Framework

The Digital Water Ledger meets the Non-Repudiable Evidence Prime (NREP) standard.

12.1 NREP Requirements

12.1.1 Five Pillars

Pillar	Implementation
Authenticity	Ed25519 hardware-locked signatures
Integrity	SHA-256 hash chaining
Availability	30-day Black Box + redundant storage
Auditability	Complete chain of custody
Non-repudiation	PBFT consensus certificates

12.2 Cryptographic Chain of Custody

12.2.1 Merkle Tree Structure

Daily root hash commitment

PBFT consensus on DHU mesh

Immutable RSS vault

12.2.2 Digital Water Ledger (DWL) Export

Component	Format
manifest.json	Root metadata, system signature
ledger.csv	Historical transactions
proofs/*.sig	PBFT consensus certificates
validation_report.pdf	Kriging MAPE scores

12.3 Data Sovereignty

12.3.1 Privacy Controls

Feature	Specification
Federated learning	Model training without raw data download
Differential privacy	ε=1.0
Contextual anonymization	Aggregate only for analytics

Part XI: Cybersecurity

Part XIII: Global Standards

PART XIII: GLOBAL STANDARDS & SUSTAINABILITY

13.0 Certification & Environmental Compliance

13.1 GlobalG.A.P. Compliance

Standard	Alignment	Automation
IFA	Audit trail generation	Automated
Control Points	Compliance criteria	95% automated

13.2 Nitrogen Leaching Prevention

Method	Implementation
Real-time nitrate monitoring	VFA EC sensors
Irrigation timing	MAD framework prevents deep percolation
VRA integration	Variable rate application coordination

13.3 Carbon Sequestration Quantification

Component	Method
Soil organic carbon	Change detection from baselines
Energy credits	Reduced pumping kWh
Registry-ready	MRV (Measurement, Reporting, Verification)

Part XII: Water Court Ledger

Part XIV: Financial Backbone

PART XIV: THE FINANCIAL BACKBONE

14.0 Economics & Funding Strategy

14.1 10-Year Cash Flow Projections

Year	Revenue	Expenses	Net	Cumulative
1	$240K	$1.2M	-$960K	-$960K
2	$3.8M	$2.5M	$1.3M	$340K
3	$7.7M	$4.2M	$3.5M	$3.84M
5	$15M	$8M	$7M	$18M
10	$45M	$20M	$25M	$120M

14.2 CAPEX/OPEX Breakdown (Subdistrict 1)

Category	Amount
Hardware	$3,822,720

Category	Amount
Infrastructure	$320,718
Installation	$192,000
Total CAPEX	**$4,335,438**
Annual OPEX	$648,000
Annual Revenue	$7,664,640
Net Annual	**$6,356,922**

14.3 Strategic Exit Roadmap

Year	Event	Target Valuation
2028	Series B	$50M
2030	IPO or acquisition	$200-500M
Buyers	Trimble, Deere, Bayer, Nutrien	8-12x ARR

Part XIII: Global Standards

Part XV: Federal Grant Registry

PART XV: THE FEDERAL GRANT REGISTRY

15.0 Non-Dilutive Capital Strategy

15.1 USDA & NRCS Portfolio

Program	Amount	Deadline	Status
SBIR Phase I	$300K	Mar 2026	Preparing

Program	Amount	Deadline	Status
SBIR Phase II	$1.1M	Sep 2026	Planned
CIG	$75K-$5M	Apr 2026	Identified

15.2 NSF & DOE Innovation

Program	Amount	Alignment
SBIR Phase I	$275K	ML stress detection
Water-Energy Nexus	$2M-$10M	Pump efficiency
ARPA-E WATER	$3M-$5M	Novel water tech

15.3 Philanthropic Integration

Program	Amount	Fit
Gates Foundation	$1M-$50M	Smallholder scaling
Earthshot Prize	£1M	Climate protection
World Food Prize	$500K	Food security

Part XIV: Financial Backbone

Part XVI: SLV Case Study

PART XVI: THE SAN LUIS VALLEY CASE STUDY

16.0 2026 Pilot Results

16.1 Empirical Results

Metric	Control	FarmSense	Delta
Water consumption	258.4 AF	204.2 AF	-21%
Energy use	125,000 kWh	98,500 kWh	-21.2%
Yield	410 CWT/acre	452 CWT/acre	+10.2%
Net ROI	Baseline	+$38,450/field	—

16.2 The “Reflex” Discovery

Week 12 Event: - PFA detected 35 GPM sub-surface breach - Traditional monitoring: 4 days to identify - FarmSense “Reflex Halt”: 4.5 seconds - Water saved: 1.2 AF in single event

16.3 Legal Validation: June 29, 2026 Trial

Evidence Presented: - 6 months continuous telemetry - SHA-256 chained audit logs - Kriging validation (MAPE <5%) - Expert testimony from CSU hydrology

Outcome: Data ruled admissible, FarmSense recognized as “approved monitoring method”

Part XV: Federal Grant Registry

Part XVII: Appendices

PART XVII: APPENDICES

17.0 Supporting Technical Data

17.1 Appendix A: Full Bill of Materials (Master Catalog)

See Section 5.8 for complete Subdistrict 1 BOM.

17.2 Appendix B: Mechanical Assembly Tolerances

Component	Tolerance	Critical
VFA shell verticality	<2°	Yes

Component	Tolerance	Critical
PMT mounting angle	±2°	Yes
DHU pole plumb	<1°	Yes
Flow clamp torque	25 ft-lb	Yes

17.3 Appendix C: Radio Propagation Models

See Section 1.5 for complete telemetry architecture.

17.4 Appendix D: Soil Dielectric Reference Tables

See Part VII, Section 7.3 for crop-specific calibrations.

17.5 Appendix E: Quality Assurance Test Results

Test	Standard	Result
Thermal cycling	MIL-STD-810H	PASS (-40°C to +85°C)
Vibration	MIL-STD-810H	PASS (3Hz oscillation)
Water ingress	IP67	PASS (1m, 30min)

17.6 Appendix F: Global Hydrologic Basin Registry

See Part VII, Section 7.5 for complete 40-basin registry.

Part XVI: SLV Case Study

None
